

DESCRIPTION OF A NEW SPECIES OF *RHAGADA* FROM  
WESTERN AUSTRALIA.

By H. B. PRESTON, F.Z.S.

Read 10th April, 1908.

*RHAGADA RADLEYI*, n.sp.

Shell discoidal, depressed, white, painted above the periphery with two greyish-brown bands, and below with five bands of the same colour; whorls  $4\frac{1}{2}$ , transversely marked with lines of growth, the last whorl descending; sutures well impressed; aperture rather oblique, roundly lunate; peristome expanded, scarcely reflexed; columella descending obliquely, expanded over and *almost* sealing the umbilicus and diffused above into a light parietal callus. Alt. 8.5, diam. maj. 15 mm.; aperture, alt. 6, diam. 4 mm.

*Hab.*—Western Australia.

Allied to *R. Reinga*, Gray, but smaller, and much more depressed; the umbilicus also is not quite closed, as is invariably the case in that species.
